Abstract

In this vignette, we give short examples how to produce new distributions in packages "`distr`" and "`distrEx`".

Basically there are three ways to produce new distributions in packages "`distr`" and "`distrEx`":

1. automatic generation of single distribution objects by arithmetics and the like
2. using generating functions to produce single distribution objects
3. defining new distribution classes / doing it from scratch

We will give short examples of all three of them.

1 Automatic generation by arithmetics and the like

We have made available quite general arithmetical operations to our distribution objects, generating new image distribution objects automatically. As an example, try

```

Comment:

Let `N` an object of class `"Norm"` with parameters `mean=2`, `sd=1.3` and let `P` an object of class `"Pois"` with parameter `lambda=1.2`. Assigning to `Z` the expression `2*N+3+P`, a new distribution object is generated —of class `"AbscontDistribution"` in our case— so that identifying `N`, `P`, `Z` with random variables distributed according to `N`, `P`, `Z`, $\mathcal{L}(Z) = \mathcal{L}(2*N+3+P)$, and writing `p(Z)(0.4)` we get $P(Z \leq 0.4)$, `q(Z)(0.3)` the 30%-quantile of `Z`, and with `r(Z)(50)` we generate 50 pseudo random numbers distributed according to `Z`, while the `plot` command generates the above figure.

There are caveats to take care about; for details refer to the (larger) vignette `distr` in package `"distrDoc"`.

2 Using generating functions

If you want to generate a single distribution object (without any particular parameter) generating functions are the method of choice:

Objects of classes `LatticeDistribution` resp. `DiscreteDistribution`, `AbscontDistribution`, may be generated using the generating functions `LatticeDistribution()` resp. `DiscreteDistribution()` resp. `AbscontDistribution()`; see also the corresponding help.

E.g., to produce a discrete distribution with support (1,5,7,21) with corresponding probabilities (0.1,0.1,0.6,0.2) we may write

```
> D ← DiscreteDistribution(supp = c(1,5,7,21), prob = c(0.1,0.1,0.6,0.2))
> D
```

Distribution Object of Class: DiscreteDistribution

```
> plot(D, panel.first = grid(), lwd = 2)
```

and to generate an absolutely continuous distribution with density proportional to $e^{-|x|^3}$, we write

```
> AC ← AbscontDistribution(d = function(x) exp(-abs(x)^3), withStand = TRUE)
> AC
```

Distribution Object of Class: AbscontDistribution

```
> plot(AC, panel.first = grid(), lwd = 2)
```

3 Doing it from scratch

If you would like to create new parametric distributions, using already implemented `r`, `d`, `p`, and `q` functions (e.g. implementing additional distributions realized in another [CRAN](#) package), you should probably envisage introducing new distribution `S4` (sub-)classes and hence better look at the implementation of some discrete and continuous parametric distribution classes in package `"distr"`.

Hint: download the `.tar.gz` file; extract it to some `temp` folder; look at subdirectories `R` and `man`

The general procedure is as follows

1. introduce a new subclass of class `Parameter`
2. introduce a new subclass of `LatticeDistribution/DiscreteDistribution` (if discrete) or of class `AbsContDistribution` (if continuous).
3. define accessor and replacement functions for the “slots” of the parameter (e.g. `"size"` and `"prob"` in the binomial case), possibly with new generics
4. (possibly) define a validity function
5. define a generating function

6. if existing, define particular convolution methods or similar particular methods for this new distribution class
7. create .Rd files for the
 - parameter class
 - distribution class
8. if analytic expressions are available, define particular `E-`, `var-`, `skewness-`, and `kurtosis-` methods and if so, also document¹ the corresponding methods in the distribution class .Rd file

Let's go through the steps in the example case of the Binomial implementation in packages "distr" and "distrEx":

1. in "distr", see source in `R/AllClasses.R`, lines 181–190

```
## Class: BinomParameter
setClass("BinomParameter",
  representation = representation(size = "numeric", prob = "numeric"),
  prototype = prototype(size = 1, prob = 0.5, name =
    gettext("Parameter_of_a_Binomial_distribution")
  ),
  contains = "Parameter"
)

#-
```

2. in "distr", see source in `R/AllClasses.R`, lines 830–857

```
## Class: binomial distribution
setClass("Binom",
  prototype = prototype(
    r = function(n){ rbinom(n, size = 1, prob = 0.5) },
    d = function(x, log = FALSE){
      dbinom(x, size = 1, prob = 0.5, log = log)
    },
    p = function(q, lower.tail = TRUE, log.p = FALSE){
      pbinom(q, size = 1, prob = 0.5,
        lower.tail = lower.tail, log.p = log.p)
    },
  )
)
```

¹this is new, because so far, all `E-`, `var-`, `skewness-`, and `kurtosis-` methods for “basic” distributions are documented in the "distrEx" documentation to `E`, `var`, ..., but this would not be operational any longer for new derived classes, possibly defined in other, new packages

```

        q = function(p, lower.tail = TRUE, log.p = FALSE ){
            qbinom(p, size = 1, prob = 0.5,
                  lower.tail = lower.tail, log.p = log.p)
        },
        img = new("Naturals"),
        param = new("BinomParameter"),
        support = 0:1,
        lattice = new("Lattice",
                      pivot = 0, width = 1, Length = 2, name =
                      gettext(
                        "lattice_of_a_Binomial_distribution"
                      )
        ),
    ),
    contains = "LatticeDistribution"
)

```

3. in "distr", see source in R/BinomialDistribution.R, lines 8–16 and 43–53

```

## Access Methods
setMethod("size", "BinomParameter", function(object) object@size)
setMethod("prob", "BinomParameter", function(object) object@prob)
## Replace Methods
setReplaceMethod("size", "BinomParameter",
                  function(object, value){ object@size <- value; object})
setReplaceMethod("prob", "BinomParameter",
                  function(object, value){ object@prob <- value; object})

## wrapped access methods
setMethod("prob", "Binom", function(object) prob(param(object)))
setMethod("size", "Binom", function(object) size(param(object)))
## wrapped replace methods
setMethod("prob<=", "Binom",
          function(object, value) new("Binom", prob = value,
                                       size = size(object)))
setMethod("size<=", "Binom",
          function(object, value) new("Binom", prob = prob(object),
                                       size = value))

```

and R/AllGenerics, lines 142–146

```

if(!isGeneric("size"))
  setGeneric("size", function(object) standardGeneric("size"))
if(!isGeneric("prob"))
  setGeneric("prob", function(object) standardGeneric("prob"))

```

4. in "distr", see source in R/BinomialDistribution.R, lines 18–33

```

setValidity("BinomParameter", function(object){
  if(length(prob(object)) != 1)
    stop("prob_has_to_be_a_numeric_of_length_1")
  if(prob(object) < 0)
    stop("prob_has_to_be_in_[0,1]")
  if(prob(object) > 1)
    stop("prob_has_to_be_in_[0,1]")
  if(length(size(object)) != 1)
    stop("size_has_to_be_a_numeric_of_length_1")
  if(size(object) < 1)
    stop("size_has_to_be_a_natural_greater_than_0")
  if(!identical(floor(size(object)), size(object)))
    stop("size_has_to_be_a_natural_greater_than_0")
  else return(TRUE)
})

```

5. in "distr", see source in R/BinomialDistribution.R, line 41

```

Binom ← function(size = 1, prob = 0.5) new("Binom", size = size, prob = prob)

```

6. in "distr", see source in R/BinomialDistribution.R, lines 54–69

```

## Convolution for two binomial distributions Bin(n1,p1) and Bin(n2,p2)
## Distinguish cases
## p1 == p2 und p1 != p2

```

```

setMethod("+", c("Binom", "Binom"),
  function(e1, e2){
    newsize ← size(e1) + size(e2)

    if(isTRUE(all.equal(prob(e1), prob(e2))))
      return(new("Binom", prob = prob(e1), size = newsize,
        .withArith = TRUE))

    return(as(e1, "LatticeDistribution") + e2)
  })

```

7. in "distr", see sources in

```

- you could have: `man/Binom.Rd` for the generating function; in the Binomial case, documentation is in `Binom-class.Rd`; but in case of the Gumbel distribution, in package "`distrEx`", there is such an extra `.Rd` file

8. in "`distrEx`", see sources in

- `Expectation.R`, lines 293–299

```

setMethod("E", signature(object = "Binom",
                           fun = "missing",
                           cond = "missing"),
  function(object, fun, cond){
    return(size(object)*prob(object))
  })

```

- `Functionals.R`, lines 158–165

```

setMethod("var", signature(x = "Binom"),
  function(x, ...) {
    if((hasArg(fun)) || (hasArg(cond)))
      return(var(as(x, "DiscreteDistribution"), ...))
    else
      return(size(x)*prob(x)*(1-prob(x)))
  })

```

- `skewness.R`, lines 60–67

```

setMethod("skewness", signature(x = "Binom"),
  function(x, ...) {
    if((hasArg(fun)) || (hasArg(cond)))
      return(skewness(as(x, "DiscreteDistribution"), ...))
    else
      return((1-2*prob(x))/sqrt(size(x)*prob(x)*(1-prob(x))))
  })

```

- `kurtosis.R`, lines 69–77

```

setMethod("kurtosis", signature(x = "Binom"),
  function(x, ...) {
    if((hasArg(fun)) || (hasArg(cond)))
      return(kurtosis(as(x, "DiscreteDistribution"), ...))
    else
      p <- prob(x)
      return((1-6*p*(1-p))/(size(x)*p*(1-p)))
  })

```

The procedure will be similar for *any* new class of distributions.

Comment In the classes in package "**distr**" (historically the “oldest” in the development of this project), we still use **initialize** methods; this is no longer needed, if you provide generating functions; for this “more recent” approach, confer the realization of class **Gumbel** in package "**distrEx**".

4 Help needed / collaboration welcome

You are — as announced on <http://distr.r-forge.r-project.org> — very welcome to collaborate in this project! See in particular <http://distr.r-forge.r-project.org/HOWTO-collaborate.txt>

With this you should be able to start working.
