Abstract

In this vignette, we give short examples how to produce new distributions in packages "**distr**" and "**distrEx**". This vignette refers to package version 2.2.

Basically there are three ways to produce new distributions in packages "**distr**" and "**distrEx**":

1. automatic generation of single distribution objects by arithmetics and the like
2. using generating functions to produce single distribution objects
3. defining new distribution classes / doing it from scratch

We will give short examples of all three of them.

*Fraunhofer ITWM, Kaiserslautern

†Universität Bayreuth

1 Automatic generation by arithmetics and the like

We have made available quite general arithmetical operations to our distribution objects, generating new image distribution objects automatically. As an example, try

```
> require(distr)
> N ← Norm(mean = 2, sd = 1.3)
> P ← Pois(lambda = 1.2)
> Z ← 2*N + 3 + P
> Z
```

Distribution Object of Class: AbscontDistribution

```
> plot(Z, panel.first = grid(), lwd=2)
> p(Z)(0.4)
```

```
[1] 0.002415387
```

```
> q(Z)(0.3)
```

```
[1] 6.705068
```

```
> Zs ← r(Z)(50)
> Zs
```

```
[1] 5.532701 8.152407 8.738812 9.039050 11.551656 8.432365
[7] 5.239986 8.404160 6.163792 9.724269 10.956805 5.320585
[13] 8.662508 9.377174 11.543935 8.468410 8.150614 3.519009
[19] 7.977611 7.536713 12.391800 12.048228 6.840207 6.647138
[25] 7.951023 9.098707 4.631614 7.432282 8.150953 9.555525

[49] 10.711689 4.899141
```

Comment:

Let N an object of class "Norm" with parameters `mean=2`, `sd=1.3` and let P an object of class "Pois" with parameter `lambda=1.2`. Assigning to Z the expression `2*N+3+P`, a new distribution object is generated —of class "AbscontDistribution" in our case— so that identifying N , P , Z with random variables distributed according to N , P , Z , $\mathcal{L}(Z) = \mathcal{L}(2 * N + 3 + P)$, and writing `p(Z)(0.4)` we get $P(Z \leq 0.4)$, `q(Z)(0.3)` the 30%-quantile of Z , and with `r(Z)(50)` we generate 50 pseudo random numbers distributed according to Z , while the `plot` command generates the above figure.

There are caveats to take care about; for details refer to the (larger) vignette `distr` in package "distrDoc".

2 Using generating functions

If you want to generate a single distribution object (without any particular parameter) generating functions are the method of choice:

Objects of classes `LatticeDistribution` resp. `DiscreteDistribution`, `AbscontDistribution`, may be gen-

erated using the generating functions `LatticeDistribution()` resp. `DiscreteDistribution()` resp. `AbscontDistribution()`; see also the corresponding help.

E.g., to produce a discrete distribution with support $(1, 5, 7, 21)$ with corresponding probabilities $(0.1, 0.1, 0.6, 0.2)$ we may write

```
> D ← DiscreteDistribution(supp = c(1, 5, 7, 21), prob = c(0.1, 0.1, 0.6, 0.2))
> D
```

Distribution Object of Class: `DiscreteDistribution`

```
> plot(D, panel.first = grid(), lwd = 2)
```

Probability function of `DiscreteDistribution`

CDF of `DiscreteDistribution`

Quantile function of `DiscreteDistribution`

and to generate an absolutely continuous distribution with density proportional to $e^{-|x|^3}$, we write

```
> AC ← AbscontDistribution(d = function(x) exp(-abs(x)^3), withStand = TRUE)
> AC
```

Distribution Object of Class: `AbscontDistribution`

```
> plot(AC, panel.first = grid(), lwd = 2)
```

3 Doing it from scratch

If you would like to create new parametric distributions, using already implemented `r`, `d`, `p`, and `q` functions (e.g. implementing additional distributions realized in another [CRAN](#) package), you should probably envisage introducing new distribution `S4` (sub-)classes and hence better look at the implementation of some discrete and continuous parametric distribution classes in package "`distr`". Hint: download the `.tar.gz` file; extract it to some `temp` folder; look at subdirectories `R` and `man`

The general procedure is as follows

1. introduce a new subclass of class `Parameter`
2. introduce a new subclass of `LatticeDistribution/DiscreteDistribution` (if discrete) or of class `AbscontDistribution` (if continuous).

3. define accessor and replacement functions for the “slots” of the parameter (e.g. “`size`” and “`prob`” in the binomial case), possibly with new generics
4. (possibly) define a validity function
5. define a generating function
6. if existing, define particular convolution methods or similar particular methods for this new distribution class
7. create `.Rd` files for the
 - parameter class
 - distribution class
8. if analytic expressions are available, define particular `E`-, `var`-, `skewness`-, and `kurtosis`-methods and if so, also document¹ the corresponding methods in the distribution class `.Rd` file

Let’s go through the steps in the example case of the Binomial implementation in packages “`distr`” and “`distrEx`”:

1. in “`distr`”, see source in `R/AllClasses.R`, lines 180–189

```
## Class: BinomParameter
setClass("BinomParameter",
  representation = representation(size = "numeric", prob = "numeric"),
  prototype = prototype(size = 1, prob = 0.5, name =
    gettext("Parameter_of_a_Binomial_distribution")),
  contains = "Parameter"
)

#-
```

2. in “`distr`”, see source in `R/AllClasses.R`, lines 869–897

```
## Class: binomial distribution
setClass("Binom",
  prototype = prototype(
    r = function(n){ rbinom(n, size = 1, prob = 0.5) },
    d = function(x, log = FALSE){
      dbinom(x, size = 1, prob = 0.5, log = log)
    },
    p = function(q, lower.tail = TRUE, log.p = FALSE){
      pbinom(q, size = 1, prob = 0.5,
        lower.tail = lower.tail, log.p = log.p)
    },
```

¹this is new, because so far, all `E`-, `var`-, `skewness`-, and `kurtosis`-methods for “basic” distributions are documented in the “`distrEx`” documentation to `E`, `var`, ..., but this would not be operational any longer for new derived classes, possibly defined in other, new packages

```

q = function(p, lower.tail = TRUE, log.p = FALSE ){
  qbinom(p, size = 1, prob = 0.5,
        lower.tail = lower.tail, log.p = log.p)
},
img = new("Naturals"),
param = new("BinomParameter"),
support = 0:1,
lattice = new("Lattice",
  pivot = 0, width = 1, Length = 2, name =
  gettext(
    "lattice_of_a_Binomial_distribution"
  )
),
.logExact = TRUE,
.lowerExact = TRUE
),
contains = "LatticeDistribution"
)

```

3. in "distr", see source in R/BinomialDistribution.R, lines 8–15, and 43–53

```

## Access Methods
setMethod("size", "BinomParameter", function(object) object@size)
setMethod("prob", "BinomParameter", function(object) object@prob)
## Replace Methods
setReplaceMethod("size", "BinomParameter",
  function(object, value){ object@size ← value; object })
setReplaceMethod("prob", "BinomParameter",
  function(object, value){ object@prob ← value; object })

## wrapped access methods
setMethod("prob", "Binom", function(object) prob(param(object)))
setMethod("size", "Binom", function(object) size(param(object)))
## wrapped replace methods
setMethod("prob←", "Binom",
  function(object, value) new("Binom", prob = value,
    size = size(object)))
setMethod("size←", "Binom",
  function(object, value) new("Binom", prob = prob(object),
    size = value))

```

and R/AllGenerics, lines 143–146

```

if(!isGeneric("size"))
  setGeneric("size", function(object) standardGeneric("size"))
if(!isGeneric("prob"))
  setGeneric("prob", function(object) standardGeneric("prob"))

```

4. in "distr", see source in R/BinomialDistribution.R, lines 18–32

```

setValidity("BinomParameter", function(object){

```

```

if (length(prob(object)) != 1)
  stop("prob_has_to_be_a_numeric_of_length_1")
if (prob(object) < 0)
  stop("prob_has_to_be_in_[0,1]")
if (prob(object) > 1)
  stop("prob_has_to_be_in_[0,1]")
if (length(size(object)) != 1)
  stop("size_has_to_be_a_numeric_of_length_1")
if (size(object) < 1)
  stop("size_has_to_be_a_natural_greater_than_0")
if (!identical(floor(size(object)), size(object)))
  stop("size_has_to_be_a_natural_greater_than_0")
else return(TRUE)
})

```

5. in "distr", see source in R/BinomialDistribution.R, line 41

```
Binom ← function(size = 1, prob = 0.5) new("Binom", size = size, prob = prob)
```

6. in "distr", see source in R/BinomialDistribution.R, lines 54-68

```

## Convolution for two binomial distributions Bin(n1,p1) and Bin(n2,p2)
## Distinguish cases
## p1 == p2 und p1 != p2

```

```

setMethod("+", c("Binom", "Binom"),
  function(e1, e2){
    newsize ← size(e1) + size(e2)

    if (isTRUE(all.equal(prob(e1), prob(e2))))
      return(new("Binom", prob = prob(e1), size = newsize,
        .withArith = TRUE))

    return(as(e1, "LatticeDistribution") + e2)
  })

```

7. in "distr", see sources in

    else
      return((1-2*prob(x))/sqrt(size(x)*prob(x)*(1-prob(x))))
  })

```

- `kurtosis.R`, lines 74–86

```

setMethod("kurtosis", signature(x = "Binom"),
  function(x, ...){

```

```

dots ← match.call(call = sys.call(sys.parent(1)),
                  expand.dots = FALSE)$"..."
fun ← NULL; cond ← NULL; low ← NULL; upp ← NULL
if(hasArg(low)) low ← dots$low
if(hasArg(upp)) upp ← dots$upp
if(hasArg(fun) || hasArg(cond) || !is.null(low) || !is.null(upp))
  return(kurtosis(as(x,"DiscreteDistribution"),...))
else
  p ← prob(x)
  return((1-6*p*(1-p))/(size(x)*p*(1-p)))
})

```

The procedure will be similar for *any* new class of distributions.

Comment In the classes in package "distr" (historically the “oldest” in the development of this project), we still use `initialize` methods; this is no longer needed, if you provide generating functions; for this “more recent” approach, confer the realization of class `Gumbel` in package "distrEx".

4 Help needed / collaboration welcome

You are — as announced on <http://distr.r-forge.r-project.org> — very welcome to collaborate in this project! See in particular <http://distr.r-forge.r-project.org/HOWTO-collaborate.txt>

With this you should be able to start working.
