October 10, 2008

#### Abstract

In this vignette, we give short examples how to produce new distributions in packages "distr" and "distrEx".

Basically there are three ways to produce new distributions in packages "distr" and "distrEx":

- 1. automatic generation by arithmetics and the like
- 2. using generating functions
- 3. doing it from scratch

We will give short examples of all three of them.

# 1 Automatic generation by arithmetics and the like

We have made available quite general arithmetical operations to our distribution objects, generating new image distributions automatically. As an example, try

```

#### **Comment:**

Let N an object of class "Norm" with parameters mean=2, sd=1.3 and let P an object of class "Pois" with parameter lambda=1.2. Assigning to Z the expression 2\*N+3+P, a new distribution object is generated —of class "AbscontDistribution" in our case— so that identifying N, P, Z with random variables distributed according to N, P, Z,  $\mathcal{L}(Z) = \mathcal{L}(2*N+3+P)$ , and writing p(Z)(0.4) we get  $P(Z \leq 0.4)$ , q(Z)(0.3) the 30%-quantile of Z, and with r(Z)(50) we generate 50 pseudo random numbers distributed according to Z, while the plot command generates the above figure.

There a caveats to take care about; for details refer to the (larger) vignette distr in package "distrDoc".

## 2 Using generating functions

If you want to generate a single distribution (without any particular parameter) generating functions are the method of choice:

Objects of classes LatticeDistribution resp. DiscreteDistribution, AbscontDistribution, may be generated using the generating functions LatticeDistribution() resp. DiscreteDistribution() resp. AbscontDistribution(); see also the corresponding help.

E.g., to produce a discrete distribution with support (1,5,7,21) with corresponding probabilities (0.1,0.1,0.6,0.2) we may write

```
> D \leftarrow DiscreteDistribution(supp = c(1,5,7,21), prob = c(0.1,0.1,0.6,0.2)) > D
```

## Distribution Object of Class: DiscreteDistribution

#### > plot(D)

and to generate an absolutely continuos distribution with density proportional to  $e^{-|x|^3}$ , we write

```
> AC \leftarrow AbscontDistribution(d = function(x) exp(-abs(x)^3), withStand = TRUE) > AC
```

Distribution Object of Class: AbscontDistribution

> plot(AC)

## 3 Doing it from scratch

If you would like to create new parametric distributions, using already implemented r, d, p, and q functions (e.g. implementing additional distributions realized in another CRAN package), you should probably better look at the implementation of some discrete and continuous parametric distributions in package "distr".

Hint: download the .tar.gz file; extract it to some temp folder; look at subdirectories R and man

The general procedure is as follows

- 1. introduce a new subclass of class Parameter
- 2. introduce a new subclass of LatticeDistribution/DiscreteDistribution (if discrete) or of class AbsContDistribution (if continuous).
- 3. define accessor and replacement functions for the "slots" of the parameter (e.g. "size" and "prob" in the binomial case), possibly with new generics
- 4. (possibly) define a validity function
- 5. define a generating function

- 6. if existing, define particular convolution methods or similar particular methods for this new distribution class
- 7. create .Rd files for the

#-

- parameter class
- distribution class
- 8. if analytic expressions are available, define particular E-, var-, skewness-, and kurto-sis-methods and if so, also document<sup>1</sup> the corresponding methods in the distribution class .Rd file

Let's go through the steps in the example case of the Binomial implementation in packages "distr" and "distrEx":

1. in "distr", see source in R/AllClasses.R, lines 181-190

2. in "distr", see source in R/AllClasses.R, lines 830-857

<sup>&</sup>lt;sup>1</sup>this is new, because so far, all E-, var-, skewness-, and kurtosis-methods for "basic" distributions are documented in the "distrEx" documentation to E, var, ..., but this would not be operational any longer for new derived classes, possibly defined in other, new packages

```
q = function(p, lower.tail = TRUE, log.p = FALSE)
                                  \mathbf{qbinom}(\mathbf{p}, \text{ size} = 1, \text{ prob} = 0.5,
                                         lower.tail = lower.tail, log.p = log.p)
                          img = new("Naturals"),
                          param = new("BinomParameter"),
                          support = 0:1,
                          lattice = new("Lattice",
                                    pivot = 0, width = 1, Length = 2, name =
                                     gettext(
                                       "lattice_of_a_Binomial_distribution"
             contains = "LatticeDistribution"
3. in "distr", see source in R/BinomialDistribution.R, lines 8-16 and 43-53

       \alias {BinomParameter-class}
      \alias {initialize, BinomParameter-method}
```

```
Objects can be created by calls of the form \code{new("BinomParameter", prob, size)}.

Usually an object of this class is not needed on its own, it is generated automatically when an object of the class Binom
                       is instantiated.

```
setMethod("skewness", signature(x = "Binom"),
    function(x, ...){
    if((hasArg(fun))||(hasArg(cond)))
        return(skewness(as(x,"DiscreteDistribution"),...))
    else
        return((1-2*prob(x))/sqrt(size(x)*prob(x)*(1-prob(x))))
})
```

• kurtosis.R, lines 69-77

```
\begin{split} & setMethod("kurtosis", signature(x = "Binom"), \\ & & function(x, \ldots) \{ \\ & if((hasArg(fun))||(hasArg(cond))) \\ & & return(kurtosis(as(x,"DiscreteDistribution"), \ldots)) \\ & else \\ & & p \leftarrow prob(x) \\ & & return((1-6*p*(1-p))/(size(x)*p*(1-p))) \\ \}) \end{split}
```

The procedure will be similar for any new class of distributions.

Comment In the classes in package "distr" (historically the "oldest" in the development of this project), we still use initialize methods; this is no longer needed, if you provide generating functions; for this "more recent" approach, confer the realization of class Gumbel in package "distrEx".

## 4 Help needed / collaboration welcome

You are — as announced on http://distr.r-forge.r-project.org — very welcome to collaborate in this project! See in particular http://distr.r-forge.r-project.org/HOWTO-collaborate.txt

With this you should be able to start working.
